

Bidirectional Associative Memory (BAM)

Lecture 04

Stable States

Theorem

An asynchronous BAM with arbitrary weight matrix W reaches steady state in a finite number of updates.

Proof:

$$E(x,y) = -\frac{1}{2}xWy' = \begin{cases} -\frac{1}{2}x(Wy') = -\frac{1}{2}xb' = -\frac{1}{2}\sum_{i=1}^{n}b_{i}x_{i} \\ \\ -\frac{1}{2}(xW)y' = -\frac{1}{2}ay' = -\frac{1}{2}\sum_{i=1}^{k}a_{i}y_{i} \end{cases}$$
 excitations

BAM asynchronous ⇒ select neuron at random from left or right layer, compute its excitation and change state if necessary (states of other neurons not affected)

Bidirectional Associative Memory (BAM)Lecture 04neuron i of left layer has changed
$$\Rightarrow$$
 sgn $(x_i) \neq$ sgn (b_i)
 $\Rightarrow x_i$ was updated to $\tilde{x}_i = -x_i$ $E(x,y) - E(\tilde{x},y) = -\frac{1}{2} \underbrace{b_i(x_i - \tilde{x}_i)}_{<0} > 0$ $\boxed{\frac{x_i \cdot x_i \cdot x_i}{1 \cdot 0 \cdot 0}}$ use analogous argumentation if neuron of right layer has changed \Rightarrow every update (change of state) decreases energy function \Rightarrow since number of different bipolar vectors is finite
update stops after finite #updates

remark: dynamics of BAM get stable in local minimum of energy function!

Hopfield Network

Lecture 04

special case of BAM but proposed earlier (1982)

characterization:

- neurons preserve state until selected at random for update
- n neurons fully connected
- symmetric weight matrix
- no self-loops (→ zero main diagonal entries)
- thresholds θ , neuron i fires if excitations larger than θ_i

transition: select index k at random, new state is $\tilde{x} = \text{sgn}(xW - \theta)$

where
$$\tilde{x} = (x_1, \ldots, x_{k-1}, \tilde{x}_k, x_{k+1}, \ldots, x_n)$$

 $= -\frac{1}{2} \sum_{\substack{i=1\\i \neq k}}^{n} \sum_{j=1}^{n} w_{ij} x_i \underbrace{(x_j - \tilde{x}_j)}_{= 0 \text{ if } j \neq k} - \frac{1}{2} \sum_{\substack{j=1\\i \neq k}}^{n} w_{kj} x_j (x_k - \tilde{x}_k) + \theta_k (x_k - \tilde{x}_k)$

 $= -(x_k - \tilde{x}_k) \left[\underbrace{\sum_{i=1}^n w_{ik} x_i}_{\text{excitation } \mathbf{e}_k} - \theta_k \right] > 0 \qquad \text{since:} \\ \underbrace{\frac{x_k - \tilde{x}_k - \tilde{x}_k - \theta_k - \Delta E}{+1 - 20}}_{1 - 20} = 0 = 0$

 $= -\frac{1}{2} \sum_{\substack{i=1\\i\neq k}}^{n} w_{ik} x_i \left(x_k - \tilde{x}_k\right) - \frac{1}{2} \sum_{\substack{j=1\\j\neq k}}^{n} w_{kj} x_j \left(x_k - \tilde{x}_k\right) + \theta_k \left(x_k - \tilde{x}_k\right)$ (rename j to i, recall W = W^c, w_{kk} = 0)

energy of state x is
$$E(x) = -\frac{1}{2}xWx' + \theta x'$$

 $= -\sum_{i=1}^{n} w_{ik} x_i (x_k - \tilde{x}_k) + \theta_k (x_k - \tilde{x}_k)$

> 0 if $x_{k} < 0$ and vice versa

Theorem:

Hopfield network converges to local minimum of energy function after a finite number of updates.

Proof: assume that x_k has been updated $\Rightarrow \tilde{x}_k = -x_k$ and $\tilde{x}_i = x_i$ for $i \neq k$

$$E(x) - E(\tilde{x}) = -\frac{1}{2}xWx' + \theta x' + \frac{1}{2}\tilde{x}W\tilde{x}' - \theta \tilde{x}'$$

$$= -\frac{1}{2}\sum_{i=1}^{n}\sum_{j=1}^{n}w_{ij}x_{i}x_{j} + \sum_{i=1}^{n}\theta_{i}x_{i} + \frac{1}{2}\sum_{i=1}^{n}\sum_{j=1}^{n}w_{ij}\tilde{x}_{i}\tilde{x}_{j} - \sum_{i=1}^{n}\theta_{i}\tilde{x}_{i}$$

$$= -\frac{1}{2}\sum_{i=1}^{n}\sum_{j=1}^{n}w_{ij}(x_{i}x_{j} - \tilde{x}_{i}\tilde{x}_{j}) + \sum_{i=1}^{n}\theta_{i}\underbrace{(x_{i} - \tilde{x}_{i})}_{=0 \text{ if } i \neq k}$$

$$= -\frac{1}{2}\sum_{\substack{i=1\\i\neq k}}^{n}\sum_{j=1}^{n}w_{ij}(x_{i}x_{j} - \tilde{x}_{i}\tilde{x}_{j}) - \frac{1}{2}\sum_{\substack{j=1\\i\neq k}}^{n}w_{kj}(x_{k}x_{j} - \tilde{x}_{k}\tilde{x}_{j}) + \theta_{k}(x_{k} - \tilde{x}_{k})$$

$$\stackrel{\text{technische universität}}{\underbrace{0 \text{ if } j = k}} \xrightarrow{x_{j} \text{ if } j \neq k}$$

Hopfield Network

Lecture 04

Application to Combinatorial Optimization

Idea:

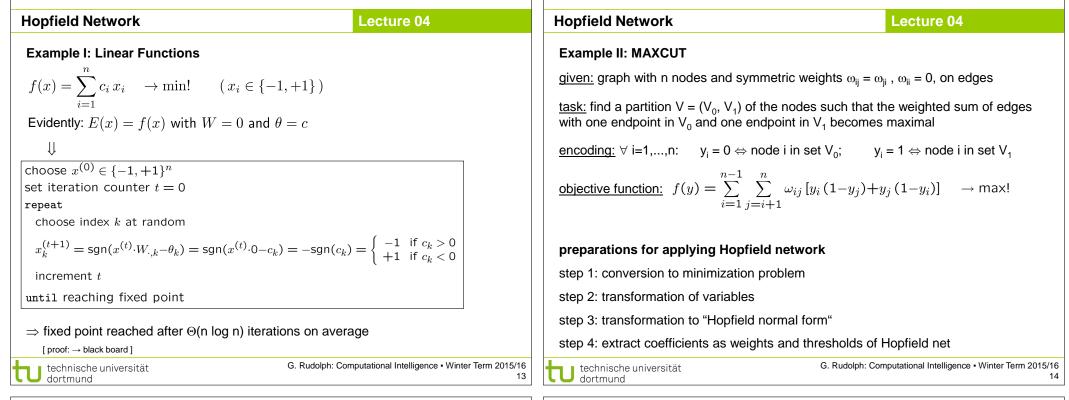

- transform combinatorial optimization problem as objective function with $x \in \{-1,+1\}^n$
- rearrange objective function to look like a Hopfield energy function
- extract weights W and thresholds θ from this energy function
- initialize a Hopfield net with these parameters W and θ
- run the Hopfield net until reaching stable state (= local minimizer of energy function)
- stable state is local minimizer of combinatorial optimization problem
