Multiobjective Optimization

Real-world problems: various demands on problem solution

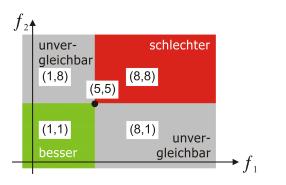

⇒ multiple conflictive objective functions

Nicola Beume (LS11) CI 2012 25.01.2012 2/28

Pareto Dominance

Nicola Beume (LS11)

partial order among vectors in \mathbb{R}^d and thus in \mathbb{R}^n

$$(1,1) \prec (5,5) \prec (8,8)$$

$$(1,8) \parallel (5,5) \parallel (8,1)$$

25.01.2012

 $\mathbf{a} \prec \mathbf{b}$, a weakly dominates $\mathbf{b} : \iff \forall i \in \{1, \dots, d\} : a_i < b_i$ $\mathbf{a} \prec \mathbf{b}$, a dominates $\mathbf{b} : \iff \mathbf{a} \leq \mathbf{b}$ and $\mathbf{a} \neq \mathbf{b}$, i.e., $\exists i \in \{1, \dots, d\} : a_i < b_i$ $\mathbf{a} \| \mathbf{b}, \mathbf{a} \text{ and } \mathbf{b} \text{ are incomparable:} \iff \text{neither } \mathbf{a} \prec \mathbf{b} \text{ nor } \mathbf{b} \prec \mathbf{a}.$

CI 2012

Multiobjective Optimization

Multiobjective Problem

$$f: S \subseteq \mathbb{R}^n \to Z \subseteq \mathbb{R}^d$$
, $\min_{\mathbf{x} \in \mathbb{R}^n} f(\mathbf{x}) = (f_1(\mathbf{x}), \dots, f_d(\mathbf{x}))$

How to relate vectors?

Nicola Beume (LS11)

CI 2012

25.01.2012

Aim of Optimization

Pareto front: set of optimal solution vectors in \mathbb{R}^d , i.e.,

$$\mathsf{PF} = \{ \mathbf{x} \in Z \mid \nexists \mathbf{x}' \in Z \text{ with } \mathbf{x}' \prec \mathbf{x} \}$$

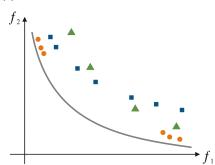

Aim of optimization: find Pareto front?

PF maybe infinitively large

PF hard to hit exactly in continuous space

⇒too ambitious!

Aim of optimization: approximate Pareto front!

Nicola Beume (LS11) CI 2012 25.01.2012

Scalarization

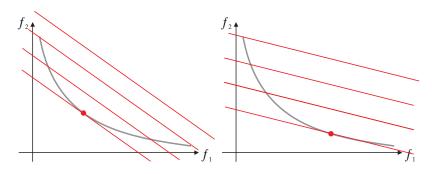

Isn't there an easier way?

Scalarize objectives to single-objective function:

$$f: S \subseteq \mathbb{R}^n \to Z \subseteq \mathbb{R}^2 \Rightarrow f_{scal} = w_1 f_1(\mathbf{x}) + w_2 f_2(\mathbf{x})$$

Result: single solution

Specify desired solution by choice of w_1, w_2

Nicola Beume (LS11) CI 2012 25.01.2012 6 / 28

Classification

a-priori approach

first specify preferences, then optimize

more advanced scalarization techniques (e.g. Tschebyscheff) allow to access all elements of PF

remaining difficulty:

how to express your desires through parameter values!?

a-posteriori approach

first optimize (approximate Pareto front), then choose solution

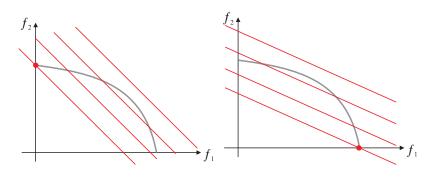

- ⇒back to a-posteriori approach
- ⇒state-of-the-art methods: evolutionary algorithms

Scalarization

Previous example: convex Pareto front

Consider concave Pareto front

- ∮ only boundary solutions are optimal
- ⇒ scalarization by simple weighting is not a good idea

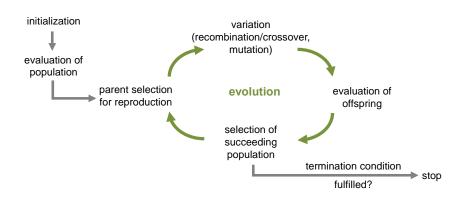

Nicola Beume (LS11)

CI 2012

25.01.2012

Evolutionary Algorithms

Evolutionary Multiobjective Optimization Algorithms (EMOA) Multiobjective Optimization Evolutionary Algorithms (MOEA)

What to change in case of multiobjective optimization? Selection!

Remaining operators may work on search space only

Nicola Beume (LS11) CI 2012 25.01.2012 8 / 28 Nicola Beume (LS11) CI 2012 25.01.2012 9 /

Selection in EMOA

Selection requires sortable population to choose best individuals

How to sort d-dimensional objective vectors?

Primary selection criterion:

use Pareto dominance relation to sort comparable individuals

Secondary selection criterion:

apply additional measure to incomparable individuals to enforce order

Nicola Beume (LS11)

CI 2012

25.01.2012

10 / 28

Non-dominated Sorting

Example for primary selection criterion

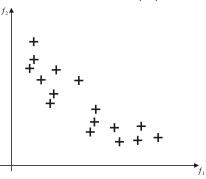

partition population into sets of mutually incomparable solutions (antichains)

non-dominated set: best elements of set

$$NDS(M) = \{ \mathbf{x} \in M \mid \nexists \mathbf{x}' \in M \text{ with } \mathbf{x}' \prec \mathbf{x} \}$$

Simple algorithm:

iteratively remove non-dominated set until population empty

Nicola Beume (LS11)

CI 2012

25.01.2012

Non-dominated Sorting

Example for primary selection criterion

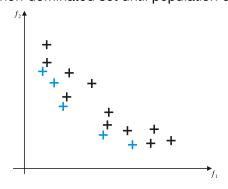

partition population into sets of mutually incomparable solutions (antichains)

non-dominated set: best elements of set

$$NDS(M) = \{ \mathbf{x} \in M \mid \nexists \mathbf{x}' \in M \text{ with } \mathbf{x}' \prec \mathbf{x} \}$$

Simple algorithm:

iteratively remove non-dominated set until population empty

Non-dominated Sorting

Example for primary selection criterion

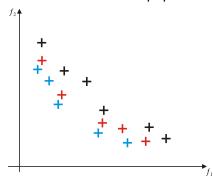

partition population into sets of mutually incomparable solutions (antichains)

non-dominated set: best elements of set

$$\mathsf{NDS}(\mathsf{M}) = \{ \mathbf{x} \in M \mid \nexists \mathbf{x}' \in M \text{ with } \mathbf{x}' \prec \mathbf{x} \}$$

Simple algorithm:

iteratively remove non-dominated set until population empty

Nicola Beume (LS11) CI 2012 25.01.2012 12 / 28 Nicola Beume (LS11) CI 2012 25.01.2012

NSGA-II

Popular EMOA: Non-dominated Sorting Genetic Algorithm II

 $(\mu + \mu)$ -selection:

- 1 perform non-dominated sorting on all $\mu + \mu$ individuals
- 2 take best subsets as long as they can be included completely
- 3 if population size μ not reached but next subset does not fit in completely: apply secondary selection criterion *crowding distance* to that subset
- 4 fill up population with best ones w.r.t. the crowding distance

Nicola Beume (LS11) CI 2012 25.01.2012 14 / 28

Difficulties of Selection

imagine point in the middle of the search space

d=2: 1/4 better, 1/4 worse, 1/2 incomparable

d=3: 1/8 better, 1/8 worse, 3/4 incomparable

general: fraction 2^{-d+1} comparable, decreases exponentially

- ⇒typical case: all individuals incomparable
- ⇒mainly secondary selection criterion in operation

Drawback of crowding distance:

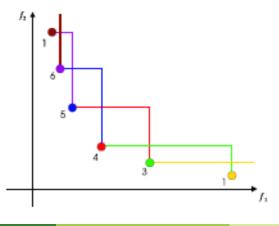

rewards spreading of points, does not reward approaching the Pareto front

 \Rightarrow NSGA-II diverges for large d, difficulties already for d=3

NSGA-II

Crowding distance:

1/2 perimeter of empty bounding box around point value of infinity for boundary points large values good

Nicola Beume (LS11)

CI 2012

25.01.2012

Difficulties of Selection

Secondary selection criterion has to be meaningful!

Desired: choose best subset of size μ from individuals

How to compare sets of partially incomparable points?

 \Rightarrow use quality indicators for sets

One approach for selection

⇒for each point: determine contribution to quality value of set

 \Rightarrow sort points according to contribution

Nicola Beume (LS11) CI 2012 25.01.2012 16 / 28 Nicola Beume (LS11) CI 2012 25.01.2012 17 /

Hypervolumen (S-metric) as Quality Measure

dominated hypervolume:

size of dominated space bounded by reference point

$$H(M,\mathbf{r}) := \mathsf{Leb}\left(igcup_{i=1}^m[\mathbf{v}^{(i)},\mathbf{r}]
ight)$$

$$M = {\mathbf{v}^{(1)}, \mathbf{v}^{(2)}, \dots, \mathbf{v}^{(m)}}$$

 $\ensuremath{\mathbf{r}}$ reference point

to be maximized

Computational complexity of hypervolume

```
Lower Bound \Omega(m \log m)
```

```
Upper Bound O(m^{d/2} \cdot 2^{O(\log^* m)})
```

proof: hypervolume as special case of Klee's measure problem

Nicola Beume (LS11) CI 2012 25.01.2012 26 / 28

Conclusions

Nicola Beume (LS11)

- real-world problems are often multiobjective
- Pareto dominance only a partial order
- a priory: parameterization difficult
- a posteriori: choose solution after knowing possible compromises
- state-of-the-art a posteriori methods: EMOA, MOEA
- EMOA require sortable population for selection
- use quality measures as secondary selection criterion
- hypervolume: excellent quality measure, but computationally intensive

CI 2012

25.01.2012

28 / 28

• use state-of-the-art EMOA, other may fail completely

Conclusions on EMOA

NSGA-II

only suitable in case of d=2 objective functions otherwise no convergence to Pareto front

SMS-EMOA

also effective for d>2 due to hypervolume hypervolume calculation time-consuming \Rightarrow use approximation of hypervolume

Other state-of-the-art EMOA, e.g.

- MO-CMA-ES: CMA-ES + hypervolume selection
- ϵ -MOEA: objective space partitioned into grid, only 1 point per cell
- MSOPS: selection acc. to ranks of different scalarizations

Nicola Beume (LS11) CI 2012 25.01.2012 27 / 28
