

# **Computational Intelligence**

Winter Term 2015/16

Prof. Dr. Günter Rudolph

Lehrstuhl für Algorithm Engineering (LS 11)

Fakultät für Informatik

TU Dortmund

# Swarm Intelligence

Lecture 13

#### Contents

• Ant algorithms (combinatorial optimization)

Particle swarm algorithms (o

(optimization in  $\mathbb{R}^n$ )

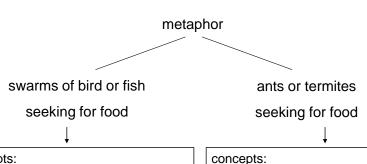

technische universität dortmund

G. Rudolph: Computational Intelligence • Winter Term 2015/16

2

### **Swarm Intelligence**

Lecture 13

### concepts:

- evaluation of own current situation
- comparison with other conspecific
- imitation of behavior of successful conspecifics
- ⇒ audio-visual communication

• communication / coordination by means of "stigmergy"

- reinforcement learning
  - $\rightarrow \text{positive feedback}$
- ⇒ olfactoric communication

### **Swarm Intelligence**

Lecture 13

ant algorithms (ACO: Ant Colony Optimization)

paradigm for design of metaheuristics for combinatorial optimization

stigmergy = indirect communication through modification of environment

 $\sim$  1991 Colorni / Dorigo / Maniezzo: Ant System (also: 1. ECAL, Paris 1991) <u>Dorigo</u> (1992): collective behavor of social insects (PhD)

#### some facts:

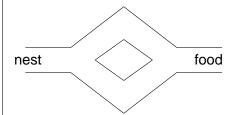

- about 2% of all insects are social
- about 50% of all social insects are ants
- total weight of all ants = total weight of all humans
- ants populate earth since 100 millions years
- humans populate earth since 50.000 years
- technische universität

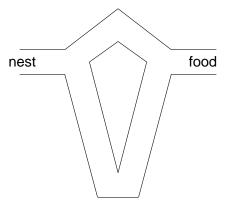

dortmund

### **Swarm Intelligence**

### Lecture 13

double bridge experiment (Deneubourg et al. 1990, Goss et al. 1989)

### initially:

both bridges used equally often

#### finally:

all ants run over single bridge only!

finally:

all ants use the shorter bridge!

G. Rudolph: Computational Intelligence • Winter Term 2015/16

## **Swarm Intelligence**

Lecture 13

### Ant System (AS) 1991

combinatorial problem:

- components  $C = \{ c_1, c_2, ..., c_n \}$
- feasible set  $F \subset 2^C$
- objective function f:  $2^{\mathbb{C}} \to \mathbb{R}$

**ants** = set of concurrent (or parallel) asynchronous agents move through state of problems

partial solutions of problems

→ caused by movement of ants the final solution is compiled incrementally

# technische universität

G. Rudolph: Computational Intelligence • Winter Term 2015/16

### **Swarm Intelligence**

Lecture 13

#### How does it work?

- ants place pheromons on their way
- routing depends on concentration of pheromons

#### more detailed:

ants that use shorter bridge return faster

- → pheromone concentration higher on shorter bridge
- $\rightarrow$  ants choose shorter bridge more frequently than longer bridge
- → pheromon concentration on shorter bridge even higher
- → even more ants choose shorter bridge
- $\rightarrow$  a.s.f.

positive feedback loop

G. Rudolph: Computational Intelligence • Winter Term 2015/16

### **Swarm Intelligence**

Lecture 13

### movement: stochastic local decision

(2 parameters) 'trails' 'attractiveness' paths excitement, stimulus

while constructing the solution (if possible), otherwise at the end:

1. evaluation of solutions

technische universität

2. modification of 'trail value' of components on the path

feedback

G. Rudolph: Computational Intelligence • Winter Term 2015/16

### **Swarm Intelligence**

Lecture 13

#### ant k in state i

- determine all possible continuations of current state i
- ullet choice of continuation according to probability distribution  $p_{ij}$

 $p_{ij} = q(attractivity, amount of pheromone)$ 

heuristic is based on *a priori* desirability of the move

a posteriori desirability of the move "how rewarding was the move in the past?"

 update of pheromone amount on the paths: as soon as all ants have compiled their solutions good solution ↑ increase amount of pheromone, otherwise decrease ↓

G. Rudolph: Computational Intelligence • Winter Term 2015/16

### **Swarm Intelligence**

Lecture 13

#### two additional mechanisms:

- 1. trail evaporation
- 2. demon actions (for centralized actions; not executable in general)

Ant System (AS) is prototype

tested on TSP-Benchmark  $\rightarrow$  not competitive

→ but: works in principle!

subsequent: 2 targets

- 1. increase efficiency (→ competitiveness with *state-of-the-art* method)
- 2. better explanation of behavior

1995 ANT-Q (Gambardella & Dorigo), simplified: 1996 ACS ant colony system

#### technische universität dortmund

#### **Swarm Intelligence**

#### Lecture 13

### **Combinatorial Problems** (Example TSP)

### TSP:

- ant starts in arbitrary city i
- pheromone on edges (i, j):  $\tau_{ij}$  probability to move from i to j:  $p_{ij}^{(t)} = \frac{\tau_{ij}^{\alpha}\,\eta_{ij}^{\beta}}{\sum\limits_{k\in\mathcal{N}_i(t)}\tau_{ik}^{\alpha}\,\eta_{ik}^{\beta}} \quad \text{for } j\in\mathcal{N}_i(t)$
- $\eta_{ii} = 1/d_{ii}$ ;  $d_{ii} = distance$  between city i and j
- $\alpha$  = 1 and  $\beta \in [2, 5]$  (empirical),  $\rho \in (0,1)$  "evaporation rate"
- $\mathcal{N}_i(t)$  = neighborhood of i at time step t (without cities already visited)
- update of pheromone after  $\mu$  journeys of ants:  $\tau_{ij} := \rho \tau_{ij} + \sum_{k=1}^{r} \Delta \tau_{ij}(k)$
- $\Delta \tau_{ii}(k) = 1$  / (tour length of ant k), if (i,j) belongs to tour

### **Swarm Intelligence**

Lecture 13

### **Particle Swarm Optimization (PSO)**

↓
abstraction from fish / bird / bee swarm

paradigm for design of metaheuristics for continuous optimization

developed by Russel Eberhard & James Kennedy (~1995)

### concepts:

- particle (x, v) consists of position  $x \in \mathbb{R}^n$  and "velocity" (i.e. direction)  $v \in \mathbb{R}^n$
- PSO maintains multiple potential solutions at one time
- during each iteration, each solution/position is evaluated by an objective function
- particles "fly" or "swarm" through the search space to find position of an extremal value returned by the objective function

### **Swarm Intelligence**

#### Lecture 13

### PSO update of particle $(x_i, v_i)$ at iteration t

#### 1st step:

$$v_i(t+1) = \omega \, v_i(t) + \gamma_1 \, R_1 \, (x_b^*(t) - x_i(t)) + \gamma_2 \, R_2 \, (x^*(t) - x_i(t))$$
 
$$\downarrow \qquad \qquad \downarrow \qquad$$

 $i = 1, ..., \mu$ 

G. Rudolph: Computational Intelligence • Winter Term 2015/16

### **Swarm Intelligence**

### Lecture 13

### PSO update of particle $(x_i, v_i)$ at iteration t

### 2nd step:

$$x_i(t+1) = x_i(t) + v_i(t+1)$$

new old new position position direction

Note the similarity to the concept of mutative step size control in EAs: first change the step size (direction), then use changed step size (direction) for changing position.

 $\tau = 0, ..., t$ 

### **Swarm Intelligence**

Lecture 13

### PSO update of particle $(x_i, v_i)$ at iteration t

#### 1st step:

$$v_i(t+1) = \omega v_i(t) + \gamma_1 R_1 (x_b^*(t) - x_i(t)) + \gamma_2 R_2 (x^*(t) - x_i(t))$$

new old direction from direction direction  $x_i(t)$  to  $x_b^*(t)$   $x_i(t)$  to  $x^*(t)$ 

 $\begin{array}{lll} \omega & : & \text{inertia factor, often} \in [0.8, 1.2] \\ \gamma_1 & : & \text{cognitive factor, often} \in [1.7, 2.0] \\ \gamma_2 & : & \text{social factor, often} \in [1.7, 2.0] \\ R_1 & : & \text{positive r.v., often} \ r_1 \sim U[0, 1] \\ R_2 & : & \text{positive r.v., often} \ r_2 \sim U[0, 1] \end{array}$ 

G. Rudolph: Computational Intelligence • Winter Term 2015/16

### **Swarm Intelligence**

### Lecture 13

### More swarm algorithms:

- Artificial Bee Colony
- Krill Herd Algorithm
- Firefly Algorithm
- Glowworm Swarm
- ...

#### But be watchful:

Is there a new algorithmic idea inspired from the biological system?

Take a look at the code / formulas: Discover similarities & differences!

Often: "Old wine in new skins."
