### **Scalarization**

#### Isn't there an easier way?

Scalarize objectives to single-objective function:  $f: S \subseteq \mathbb{R}^n \to Z \subseteq \mathbb{R}^2 \Rightarrow \quad f_{scal} = w_1 f_1(\mathbf{x}) + w_2 f_2(\mathbf{x})$ 

Result: single solution Specify desired solution by choice of  $w_1, w_2$ 

### **Classification**

#### a-priori approach

first specify preferences, then optimize

more advanced scalarization techniques (e.g. Tschebyscheff) allow to access all elements of PF

#### remaining difficulty:

how to express your desires through parameter values !?

#### a-posteriori approach

first optimize (approximate Pareto front), then choose solution

#### $\Rightarrow$ back to a-posteriori approach

 $\Rightarrow$  state-of-the-art methods: evolutionary algorithms

### **Scalarization**

Previous example: convex Pareto front

Consider concave Pareto front

- $\oint$  only boundary solutions are optimal
- $\Rightarrow$  scalarization by simple weighting is not a good idea

CI 2012

### **Evolutionary Algorithms**

### **Selection in EMOA**

Selection requires sortable population to choose best individuals

How to sort d-dimensional objective vectors?

#### Primary selection criterion:

use Pareto dominance relation to sort comparable individuals

#### Secondary selection criterion:

apply additional measure to incomparable individuals to enforce order

### **Non-dominated Sorting**

Example for primary selection criterion

partition population into sets of mutually incomparable solutions (antichains)

non-dominated set: best elements of set

 $\mathsf{NDS}(\mathsf{M}) = \{ \mathbf{x} \in M \mid \nexists \mathbf{x}' \in M \text{ with } \mathbf{x}' \prec \mathbf{x} \}$ 

#### Simple algorithm:

iteratively remove non-dominated set until population empty

### **Non-dominated Sorting**

Example for primary selection criterion

partition population into sets of mutually incomparable solutions (antichains)

CI 2012

non-dominated set: best elements of set

 $\mathsf{NDS}(\mathsf{M}) = \{ \mathbf{x} \in M \mid \nexists \mathbf{x}' \in M \text{ with } \mathbf{x}' \prec \mathbf{x} \}$ 

#### Simple algorithm:

Nicola Beume (LS11)

iteratively remove non-dominated set until population empty

CI 2012

### **NSGA-II**

Popular EMOA: Non-dominated Sorting Genetic Algorithm II

 $(\mu + \mu)$ -selection:

Nicola Beume (LS11)

- **1** perform non-dominated sorting on all  $\mu + \mu$  individuals
- 2 take best subsets as long as they can be included completely
- **3** if population size  $\mu$  not reached but next subset does not fit in completely:

CI 2012

### **NSGA-II**

#### Crowding distance:

Nicola Beume (LS11)

CI 2012

25.01.2012

17/28

1/2 perimeter of empty bounding box around point value of infinity for boundary points large values good

### **Computational complexity of hypervolume**

### Lower Bound $\Omega(m \log m)$

#### Upper Bound $O(m^{d/2} \cdot 2^{O(\log^* m)})$

proof: hypervolume as special case of Klee's measure problem

### **Conclusions on EMOA**

#### NSGA-II

only suitable in case of d=2 objective functions otherwise no convergence to Pareto front

#### SMS-EMOA

also effective for d > 2 due to hypervolume hypervolume calculation time-consuming  $\Rightarrow$ use approximation of hypervolume

#### Other state-of-the-art EMOA, e.g.

- MO-CMA-ES: CMA-ES + hypervolume selection
- *c*-MOEA: objective space partitioned into grid, only 1 point per cell
- MSOPS: selection acc. to ranks of different scalarizations

28	Nicola Beume (LS11)	CI 2012	25.01.2012 27 / 28

### Conclusions

- real-world problems are often multiobjective
- Pareto dominance only a partial order
- a priory: parameterization difficult
- a posteriori: choose solution after knowing possible compromises
- state-of-the-art a posteriori methods: EMOA, MOEA
- EMOA require sortable population for selection
- use quality measures as secondary selection criterion
- hypervolume: excellent quality measure, but computationally intensive
- use state-of-the-art EMOA, other may fail completely
